

ChatGPT:

Perfect — let's recap *everything* we planned or already partially discussed for the **frontend** (based on your previous direction about filters, sorting, and exporting).

Here's the full structured list 📌

🎯 Frontend To-Do List

1. Filtering & Sorting (Core UI Logic)

✅ **Goal:** Let users refine and order their liked albums dynamically.

- Add **filter controls** (dropdowns, search inputs, etc.) for:
 - Genre
 - Year (range or specific year)
 - Artist name
 - Release type (album vs compilation, optional)
- Add **sorting controls** (dropdown or toggle):
 - Alphabetical (A–Z, Z–A)
 - Release date (newest–oldest, oldest–newest)
 - Added date (most recent liked albums first)
- Make sure **genre filter actually applies** (currently doesn't update displayed albums).
 - Fix state or filtering logic so genre selection filters albums in real time.

2. UI Updates

✅ **Goal:** Match the clean, Spotify-like aesthetic you wanted.

- Apply Tailwind layout improvements (`flex`, `gap`, `max-w-7xl`, etc.)
- Use responsive grid for albums.
- Add **loading indicator** (spinner or skeleton cards) while fetching.

- Add **“no results found”** state after filtering.
- Add **sticky header or controls bar** (filters/sort stay visible during scroll).

3. Data Fetching & State

✅ **Goal:** Keep album list reactive, fast, and synced with backend.

- Fetch albums from backend (`/api/albums`).
- Add pagination awareness — handle `totalPages` from backend.
- Implement local sorting/filtering rather than refetching every time (for speed).
- Allow **manual refresh** (button to re-fetch from backend).

4. Export Features

✅ **Goal:** Enable exporting filtered results in multiple formats.

- Add **Export CSV** and **Export JSON** buttons.
- Wire them to backend endpoints (`/api/albums/export/csv` and `/api/albums/export/json`).
- Fix broken export functionality (currently buttons don't trigger download).
 - Likely missing correct request headers or backend response handling.
 - Ensure it downloads the *filtered* list, not the entire dataset.

5. Search & Misc. UX

✅ **Goal:** Improve usability.

- Add **search bar** for quick artist/album name lookup.
- Add **“Clear Filters”** button.
- Add **results count** (e.g., “Showing 32 of 200 albums”).
- Add **smooth transitions** when filters/sorts apply.

6. Optional Enhancements

💡 For polish after core features:

- Display album popularity as a small progress bar or score.
- Add hover effects (preview cover, play icon, etc.).
- Allow multiple genre selection.
- Save filter/sort settings to localStorage.
- Add light/dark mode toggle.
